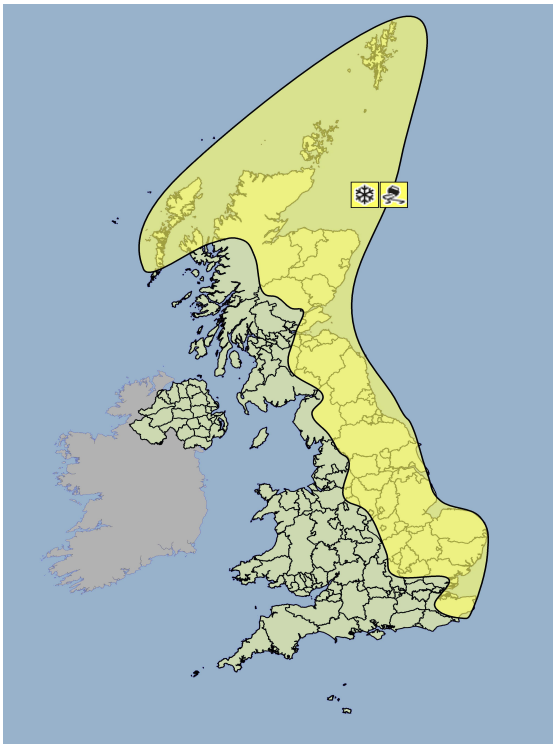
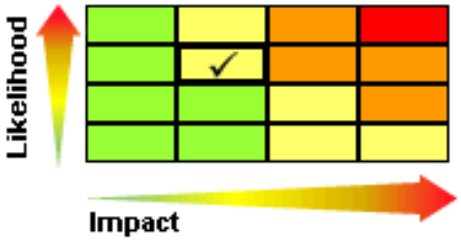
National Severe Weather Warning Service





Chief Forecasters Assessment
The colder airmass already established across Scotland and the north of England will continue south to affect most other parts by Sunday evening.

Showers will feed in on the north to northeasterly winds, particularly affecting the more northern and eastern parts of Scotland, along with northern England during Sunday daytime, but progressing further south into the north and east Midlands along with parts of east and southeast England during Sunday evening and overnight into Monday. Not everywhere will see the snow showers, but some may become aligned in bands from time to time, leading to the risk of some moderate accumulations of snow, most likely over northern Scotland and northeast England.

Ice will also be a hazard on untreated surfaces, particularly between showers overnight, with those areas just inland from the coasts of eastern and southeast England at particular risk as the showers will fall as a wintry mix.

The Met Office have issued a **Yellow Warning** of **Snow and Ice**

Valid from **10:55 on Sun, 14th Feb 2016** until **12:00 on Mon, 15th Feb 2016**

Showers of sleet and snow are likely at times during Sunday and overnight into Monday when they will also affect some southeastern parts of England, although the showers here will generally be a mix of sleet and hail near coasts. Accumulations of 0-2 cm of snow are likely in places at low levels, but locally 2-5 cm over hills and where showers become aligned in bands in the northeasterly flow. Ice will be an additional hazard overnight, particularly after showers.

Please be aware of the potential for difficult travelling conditions.
